Amendments to the Claims

- 1. (Currently amended) A journal bearing system <u>supporting a gear in a turbofan</u> <u>transmission and comprising</u>:
 - a bushing in the gear; and
- a journal pin within the bushing and rotatable relative to the bushing about a longitudinal axis,

wherein at least one of the bushing and journal pin has an engagement surface with an engagement length comprising a base material and a solid lubricant, a concentration of the solid lubricant varying longitudinally along the engagement length.

- 2. (Original) The system of claim 1 wherein:
- the concentration is higher near ends of the engagement length than in an intermediate portion.
- (Original) The system of claim 1 wherein:
 the concentration varies by at least 50% of a maximum value along said engagement length.
- 4. (Previously presented) The system of claim 1 wherein:
 the base material comprises a coating applied to a substrate of said at least one of the bushing and journal pin.
- 5. (Previously presented) The system of claim 1 wherein: the base material comprises a copper-based material; and the solid lubricant comprises a metal.
- 6. (Original) The system of claim 5 wherein: the solid lubricant metal comprises lead.
- 7. (Original) The system of claim 6 wherein the concentration is: greater than 30% at first and second locations near first and second ends of the

Ser. No. 10/725,165

engagement length; and

10-30% in an third location, between the first and second locations.

8. (Original) The system of claim 6 wherein the concentration is:

greater than 35% at first and second locations within first and second terminal 20% of the engagement length; and

10-30% over a majority of a central 50% of the length.

- 9. (Canceled)
- 10. (Currently amended) A hydrodynamic bearing apparatus comprising:
 - a bushing being a gear in a geared turbofan transmission;
- a journal pin rotatable relative to the bushing about a longitudinal axis; and means for providing extended operation after a lubricant loss comprising a coating on the bushing.
- 11. (Original) The apparatus of claim 10 wherein:
 the means comprise a longitudinally-varying lead concentration within a copper matrix.
- 12. (Canceled)
- 13. (Canceled)
- 14. (Canceled)
- 15. (Previously presented) The system of claim 1 wherein the journal pin has at least one lubrication passageway.
- 16. (Previously presented) The system of claim 15 wherein the at least one lubrication passageway extends to the engagement surface.

- 17. (Previously presented) The system of claim 5 wherein the journal pin has at least one lubrication passageway.
- 18. (Previously presented) The system of claim 17 wherein the at least one lubrication passageway extends to the engagement surface.
- 19. (Previously presented) The system of claim 7 wherein the journal pin has at least one lubrication passageway.
- 20. (Previously presented) The system of claim 19 wherein the at least one lubrication passageway extends to the engagement surface.
- 21. (Previously presented) The apparatus of claim 10 wherein the journal pin has at least one lubrication passageway.
- 22. (Currently amended) The apparatus of claim 10 wherein:

the gear is steel; and

the means is on the bushing and the bushing is formed by a coating comprising comprises substrate material and solid lubricant on an interior cylindrical surface of a steel-the gear in a geared turbofan transmission.

- 23. (Canceled)
- 24. (Previously presented) A hydrodynamic bearing apparatus comprising:
 - a bushing;
 - a journal pin rotatable relative to the bushing about a longitudinal axis;
- at least one port in at least one of the bushing and journal pin for introducing a liquid lubricant; and
- a solid lubricant within a matrix on at least one of the bushing and journal pin, a distribution of said solid lubricant forming means for providing extended operation after a loss of said liquid lubricant.

- 25. (Currently amended) The system of claim 9 <u>1</u> wherein the transmission is liquid-lubricated and the solid lubricant concentration provides extended operation after a loss of liquid lubricant.
- 26. (Previously presented) The system of claim 4 wherein: the base material comprises a copper-based material; and the solid lubricant comprises a metal.
- 27. (Previously presented) The system of claim 1 wherein said concentration is a concentration of the solid lubricant within a matrix of the base material.
- 28. (New) A journal bearing system comprising:
 - a bushing; and
- a journal pin within the bushing and rotatable relative to the bushing about a longitudinal axis,

wherein:

at least one of the bushing and journal pin has an engagement surface with an engagement length comprising a base material and a solid lubricant, a concentration of the solid lubricant varying longitudinally along the engagement length;

the base material comprises a copper-based material; and the solid lubricant metal comprises lead;

the concentration is:

greater than 30% at first and second locations near first and second ends of the engagement length; and

10-30% in an third location, between the first and second locations.

29. (New) The system of claim 28 wherein the concentration is:

greater than 35% at said first and second locations, said first and second locations within first and second terminal 20% of the engagement length; and

10-30% over a majority of a central 50% of the length.
